

SUSTAINABILITY POLICY STATEMENT

As there are many sustainable issues that may be considered for any new project, we would not offer our client any pioneering techniques and technologies that had not been completely tested and evaluated before introduction to the actual project. Any consideration of sustainable development would still attempt to foresee future developments that could easily be implemented at a later date.

Many projects completed have been commended for their apparent sustainable development, yet have incurred substantial capital investment and/or loss of some amenities. Our goal would be to demonstrate that good and effective sustainable development can be achieved economically and still maintain the required amenities of the actual building.

We consider that effective sustainable design can only be of benefit if full commitment of the client and design team members is given by all from the earliest opportunity within the overall design process. SABA would therefore play a proactive role within the initial conceptual stages of design, with respect to the building layout, function, form and the actual mechanical and electrical installations.
